The method used in this study is the quantitative research method with the type of Pre-Experimental Design in the form of The One Group Pretest-Posttest Design. Based on the results of the research that has been done, the average pretest score is 57.09 and the posttest average score is 87.04. So there is an increase of 29.97. The results of data analysis calculations using a non-parametric test (Wilcoxon Test) assisted by the SPSS version 25 application show that H_a is accepted, therefore there is a significant influence between the application of the Window Shopping learning model on the learning outcomes of Aqidah Akhlak students of class II at MI Bahrul Ulum Blawi.
